All control sequences within or programmed into the IBC shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained.
5. System software shall include a Graphic Programming Language (GPL) for all DDC control algorithms resident in standalone control modules. Any system that does not use a drag and drop method of graphical icon programming as described herein is NOT acceptable. GPL is a method used to create a sequence of operations by assembling graphic microblocks that represent each of the commands or functions necessary to complete a control sequence. Microblocks represent common logical control devices used in conventional control systems, such as relays, switches, high signal selectors, etc., in addition to the more complex DDC and energy management strategies such as PID loops and optimum start. Each microblock shall be interactive and contain the programming necessary to execute the function of the device it represents.

6. Graphic programming shall be performed while on screen and using a mouse; each microblock shall be selected from a microblock library and assembled with other microblocks necessary to complete the specified sequence. Microblocks are then interconnected on screen using graphic "wires," each forming a logical connection. Once assembled, each logical grouping of microblocks and their interconnecting wires then forms a graphic function block which may be used to control any piece of equipment with a similar point configuration and sequence of operation.
   a. Graphic Sequence: Clarity of the graphic sequence must be such that operator has the ability to verify that system programming meets the specifications, without having to learn or interpret a manufacturer's unique programming language. The graphic programming must be self-documenting and provide the operator with an understandable and exact representation of each sequence of operation.
   b. Simulation: Full simulation capability shall be provided with the graphic programming. Operator shall be able to fully simulate the constructed control sequence prior to downloading into field control modules. Simulation capabilities shall include step-by-step, accelerated time, and operator defined simulation criteria like outside weather, demand, and communication status. Multiple graphic programs shall be simulated and displayed in split screens at the same time.
   c. GPL Capabilities: Following is a minimum definition of capabilities of the Graphic Programming software:
      1) Function Block (FB): Shall be a collection of points, microblocks and wires which have been connected together for the specific purpose of controlling a piece of HVAC equipment or a single mechanical system.
      2) Logical I/O: Input/Output points shall interface with the control modules in order to read various signals and/or values or to transmit signal or values to controlled devices.
      3) BACnet Points: Shall be points that comply with the BACnet structure as defined in the BIBB's Addendum B1/B2, and the BACnet standard.
      4) Microblocks: Shall be software devices that are represented graphically and may be connected together to perform a specified sequence. A library of microblocks shall be submitted with the control contractors bid.
      5) Wires: Shall be Graphical elements used to form logical connections between microblocks and between logical I/O. Different wires types shall be used depending on whether the signal they conduct is analog or digital.
      6) Labels: Labels shall be similar to wires in that they are used to form logical connections between two points. Labels shall form a connection by reference instead of a visual connection, i.e. two points labeled 'A' on a drawing are logically connected even though there is no wire between them.
      7) Parameter: Parameter shall be a value that may be tied to microblock input.
      8) Properties: Dialog boxes shall appear after a microblock has been inserted which has editable parameters associated with it. Default parameter dialog boxes shall contain various editable and non-editable fields and shall contain 'push buttons' for the purpose of selecting default parameter settings.
      9) Icon: An icon shall be graphic representation of a software program. Each microblock has an icon associated with it that graphically describes function.
      10) Menu-bar Icon: Shall be an icon that is displayed on the menu bar on the GPL screen, which represents its associated graphic microblock.
      11) Live Graphical Programs: The Graphic Programming software must support a 'live' mode, where all input/output data, calculated data, and set points shall be displayed in a 'live' real-time mode.

7. For each piece of HVAC equipment, the entire graphic program shall be displayed through the Web Browser GUI. Operator must have the ability to scroll through the entire 'live' graphic program as necessary. Piecemeal graphic programs that only show one part of HVAC equipment program at any one time are NOT acceptable. For example, when viewing an AHU live graphic program, the operator shall see the entire AHU graphic program, not just the Heating Coil control.

Completed applications may be stored in the library for future use. Graphical User Interface screens shall be created in the same fashion. Data for the user displays is obtained by graphically linking the user display objects to the application objects to provide “real-time” data updates. Any real-time data value or object property may be connected to display its current value on a user display. Systems requiring separate software tools or processes to create applications and user interface display shall not be acceptable.

3. Programming Methods

This object shall also accommodate a utility meter time sync pulse for fixed interval demand control. Upon a prediction that will exceed the user defined demand limit (supply a minimum of 6 per day), the demand limiting object shall issue shed commands to either turn off user specified loads or modify equipment set points to effect the desired energy reduction. If the list of sheddable equipment is not enough to reduce the demand to below the set point, a message shall be displayed on the users screen (as an alarm) instructing the user to take manual actions to maintain the desired demand. The shed lists are specified by the user and shall be selectable to be shed in either a fixed or rotating order to control which equipment is shed the most often. Upon suitable reductions in demand, the demand-limiting object shall restore the equipment that was shed in the reverse order in which it was shed. Each sheddable object shall have a minimum and maximum shed time property to effect both equipment protection and occupant comfort.

6. Library shall include control objects for the following functions. All control objects shall conform to the objects as specified in the BACnet specification or approved equivalent.

a. Analog Input Object - Minimum requirement is to comply with the BACnet standard for data sharing. Allow high, low and failure limits to be assigned for alarming. Also, provide a time delay filter property to prevent nuisance alarms caused by temporary excursions above or below the user defined alarm limits.

b. Analog Output Object - Minimum requirement is to comply with the BACnet standard for data sharing.

c. Binary Input Object - Minimum requirement is to comply with the BACnet standard for data sharing. The user must be able to specify either input condition for alarming. The user must be able to specify either input condition as the "on" condition.

d. Binary Output Object - Minimum requirement is to comply with the BACnet standard for data sharing. Properties to enable minimum on and off times for equipment protection as well as start delay must be provided. An example is to link the return fan to the supply fan such that when the supply fan is started, the return fan object is also started automatically without the user having to issue separate commands or to link each object to a schedule object. In addition, the control loops, damper objects, and alarm monitoring (such as return air, supply air, and mixed air temperature objects) will be inhibited from alarming during a user-defined period after startup to allow for stabilization. When the air-handler is stopped, the interlocked return fan is also stopped, the outside air damper is closed, and other related objects within the air-handler unit are inhibited from alarming thereby eliminating nuisance alarms during the off period.

j. Temperature Override Object - Provide an object whose purpose is to provide the capability of overriding a binary output to an “On” state in the event a user specified high or low limit value is exceeded. This object is to be linked to the desired binary output object as well as to an analog object for temperature monitoring, to cause the override to be enabled. This object will execute a Start command at the Temperature Override level of start/stop command priority unless changed by the user.

k. Composite Object - Provide a container object that allows a collection of objects representing an application to be encapsulated to protect the application from tampering, or to more easily represent large applications. This object must have the ability to allow the user to select the appropriate parameters of the “contained” application that are represented on the graphical shell of this container.

All dampers shall have a minimum of 4 animation levels to show partially open, half open, mostly open, fully open, and closed position of dampers. All analog inputs shall show the actual value and engineering units on the graphic screen. Binary inputs shall be linked to flashing animated displays. Safety alarms will flash when in alarm. Filter status shall be indicated when value indicates that they are dirty. To prevent clutter on the graphic displays, symbols will only be shown for equipment that is controlled or monitored by the DDC system. Also, normal status for safeties will not be indicated, and normal status for safeties will be indicated by an image of a clean filter. Pumps and fans shall rotate when flow is proven by a monitoring device. Coils shall change color when valves are open to permit water flow through the coils.

A single click of the mouse shall bring up pop up menu that provide options to make a permanent override, change set point, or release a previous override of an output point. Analog inputs shall have pop up menus that allow setting high and low alarm limits and the ability to enable and disable alarm limits as appropriate for the sensing device. Pop up menus must be customized to include a description of the point that is being modified. Generic override menus are not permitted because they would not describe to an operator what is about to be modified. The Control Contractor shall set up all initial alarms as indicated in the point matrix.

L. Text screens shall include schedule information including current state and date and time of next scheduled event. Positioning the mouse over the current state shall permit single click access to the schedule. The schedule screen shall allow the operator to edit a yearly, weekly, daily, holiday or special event schedule for the system being viewed. Temperature values and set points shall be displayed below the schedule information, and shall have a minimum of 1 decimal place. Heating, cooling and damper out puts shall be displayed next. The OA temperature for economizer switchover shall be displayed and adjustable from the text screen. Air flow readings shall be shown with set point and actual readings. From the alarm screen, users and administrators shall be able to enable and disable alarms. Points that are in alarm shall have an alarm symbol highlighted in red. Points that are not in alarm shall be shown in gray. Alarms that are disabled shall have a way to indicate this on the alarm screen graphic.

N. Loop tuning screens shall be available through the web browser interface to save the owner the cost and time associated with using vendor specific software for tuning loops. Access to these screens shall not be provided to guests. Air handling units shall have dedicated screens for discharge air temperature, static pressure, and outside air control loops. Loop tuning screen for discharge air temperature shall include the discharge air temperature, discharge air temperature set point, cooling loop throttling range, I-gain and ramp time, heating loop throttling range, I-gain and ramp time, economizer loop throttling range, I-gain and ramp time, unoccupied heating loop throttling range, I-gain and ramp time, cooling valve output, heating valve output, and damper control output. Each loop tuning screen shall include the appropriate throttling range, I-gain and ramp time.

O. Each non-unitary controller shall have an override screen. These screens shall be available on-site for use during point-to-point check-out and commissioning. The override screen shall show the inputs and outputs for each controller with the points in their wired location. Unused points shall be shown as spares. Points that are in alarm shall have a red background, and points that are overridden shall have a blue background just as on other screens. These screens shall show the actual values that come back from the controller, not the values that may have been typed in for override at GUI if the controller software is not accepting the override value. The override screen shall also permit timed overrides.

P. Each central plant variable air volume (VAV) air-handler (AHU) shall also have a overview screen listing every associated terminal unit’s coils data in a text format that includes occupancy mode, room temperature, room set point, box flow, flow set point, temperature leaving Fan coil, % cooling and % heating. Also, each VAV AHU shall have an air balance

Air balancing screens shall permit at least 8 manual override commands: normal, position (%), flow value, flow percent, open, close, min flow, and max flow.

Q. Although only one outside air temperature sensor is needed per building, GUI shall use independent outside air temperature points, so that during check-out and commissioning, the outside air temperature for a system can be changed without changing the outside air temperature for the whole building. GUI shall also have a global outside air temperature point that can be overridden from the screen for the controller where the point is physically connected. Overriding this outside air temperature value will change it for all systems, except when outside air temperature has been overridden for an individual system.

R. System shall allow for the easy development and editing of dynamic graphics. Wizards shall be utilized to assist the operator with their manipulation of the graphic system. The operator shall be able to, through a single mouse function, select between the dynamic display mode and the graphic edit mode for the currently viewed graphic frame, assuming appropriate access level is provided to the operator. Systems requiring multiple mouse or operator keyboard commands to enter the graphic edit mode are not desirable and require thorough definition of steps involved to accomplish function.

S. Animation of system data shall be provided via graphic elements on the display frames. Standard graphic element library shall be provided to assist the operator with their implementation. The ability to define and add new animated graphic elements shall be provided. As a minimum, the ability to move, size, draw, arrange, align, layer, space, rotate, invert, duplicate, cut, copy, paste, erase any animated element shall be provided. System parameters and set points shall be assignable and modifiable by the animated graphic elements, relieving the need for keyboard commands for system manipulation.

Timber Stacks™ Albany – Product #ZZXX1321

Low-profile natural play element designed to support balance, climbing, coordination, and imaginative movement-based play. The Albany configuration utilizes timber-look vertical posts, horizontal logs, and flexible rope elements to create a freestanding challenge course suitable for elementary-age users (5–12).

- **Timber Balance Beams:** Fixed horizontal log elements arranged at varied heights to encourage balancing, stepping, and transitional movement.
- **Vertical Timber Posts:** Upright timber-look posts providing structure, visual definition, and climbing reference points for balance-based play.
- **Angled / Offset Log Elements:** Horizontally mounted logs positioned at slight offsets to increase challenge and promote coordination and body awareness.
- **Flexible Rope Connector:** Tensioned rope element spanning between vertical posts to introduce dynamic movement and balance challenge.
- **Ground-Level Play Configuration:** All play components remain at low height, supporting confidence-building play and minimizing fall risk while encouraging physical engagement.
- **Open-Ended / Imaginative Play:** Natural materials and minimal form allow children to create their own play narratives, obstacle challenges, and movement paths.

According to the manufacturer's configuration, the play element provides:

– Multiple balance-based play activities

– Low-height climbing and stepping opportunities

– Gross-motor skill development

– Natural aesthetic compatible with turf or resilient surfacing

PLAYGROUND AREA A

- ***Unity Dome with Sensory Panels*** *– Dome has openings wide enough for wheelchairs to access the center. Center net has a platform at transfer height, allowing users to be a part of the net play. Exterior has three sensory panels added. Circles of the dome are at varied diameters and spacing, allowing users to decide their own path based on their own abilities.*
- **Challenger® 350-2108:** Built to support active play including climbing, sliding, balancing, and group interaction. The structure's size and capacity make it appropriate for elementary-school-age children (5–12).
  - o **Dynamic Descent Slide** – Elevated slide providing a primary exit and active descent from the structure.
  - o **Sliding Stations / Slides** – One or more slide entry and exit points incorporated into the overall play configuration.
  - o **Vertical Climbers** – Ladder-style and/or rope climbers providing access to elevated play decks.
  - o **Angled / Rope Climbers** – Sloped rope climbing elements extending from the main structure to support strength, coordination, and varied access routes.
  - o **Horizontal Loop Ladder** – Ladder-style traversal element allowing children to move laterally across the structure (monkey-bar-type play).
  - o **Balance & Traversal Elements** – Overhead or extended arm components with suspended stepping pods or balance features promoting coordination and dynamic movement.
  - o **ADA-Access Stairs / Transfer Station with Step** – Accessible entry point allowing users to transfer onto elevated play components.
  - o **Post-Mounted Interactive Panel** – Ground-accessible interactive feature (e.g., steering-wheel-style or activity panel) mounted to the structure.
  - o **Twist-n-Shout® Components** – Rotating or spiral climbing elements incorporated into the play structure to provide additional movement-based challenges.
- o **According to the manufacturer's configuration, the structure provides:**
  – 5 elevated play activities (4 accessible)
  – 2 ground-level play activities
- ***Cozy Cocoon (secondary location): (3 total)*** *Additional sensory/quiet pod to support inclusive programming when central main play structure area is busy.*

- ***Accessible Whirl*** *– Users who can and can't transfer have the ability to play together*
- ***Swings*** *– 1 Accessible Swing seat. Placing the ADA swings seat within the row of swings seats allows the users to be a part of the play rather than on the edge of the play with their peers*
- ***Congas*** *– Zero Transfer. Auditory Sensory*
- ***Cabasa*** *- Zero Transfer. Auditory Sensory*
- ***Steppers*** *– Balance and Social Play. Large stepper is at transfer height, allowing users to transfer to sit and chat with friends.*
- ***Quattro Seesaw*** *– Backed seats and appropriate handle location provide support to users (some of our competitors use oversized seats that do not allow users to perform the movement of the seesaw on their own). Center platform is at transfer height, allowing users to transfer to the platform to sit or lay, becoming a part of the play as their peers create movement.*

SCALE: 1" = 10'-0"

EQUIPMENT BREAKDOWN:

AREA B

The customer asked that equipment be specified within Area B that does not require transfer from a wheel chair. Note, Fanning Howey has selected a post and platform style structure, allowing wheelchair access to the AeroGlider - creating a space where all abilities are able to play in challenging ways on the same structure. Modern climbers and net climbers were chosen giving the proposed structure a modern look.

Large Integrated Play Structure (main composite structure shown in turf):

- **AeroGlider –** Suspended/transfer glider element providing dynamic movement play and coordination.
- **Scavenger Hunt Panel –** Interactive activity panel supporting cognitive/visual engagement and group play.
- **Steering Wheel –** Dramatic-play steering element for imaginative and social play.
- **Tic-Tac-Toe –** Ground/deck interactive game panel for inclusive cognitive play.
- **Kaleido Climber –** Climbing element encouraging upper-body strength, coordination, and varied access routes.
- **Access Gate –** Controlled entry element into the structure's internal circulation path.
- **Accessible Stairs –** Stair access component to reach elevated portions of the structure.
- **ADA Stair –** Accessible stair/transfer component called out separately on plan (inclusive access route).
- **12" Rise Ramp –** Ramp segment providing accessible circulation with indicated rise.
- **6" Rise Ramp –** Additional ramp segment providing accessible circulation with indicated rise.
- **Spiral Slide –** Spiral slide exit element providing active descent from elevated play area.
- **Dynamic Descent (2 locations) –** Labeled descent elements providing slide/exit points on both sides of the structure.
- **Round the Corner –** Curved path/feature element encouraging circulation and movement through the structure.
- **Bells –** Interactive musical/sensory play element.
- **Steppers –** Stepping pod elements promoting balance, coordination, and sequencing.
- **Disco Spinner –** Rotating play component integrated into/adjacent to the structure for vestibular play.
- **Double Dynamic Terrace –** Elevated terrace platform element (as labeled) supporting group gathering and circulation on the structure.

Stand-Alone Equipment (outside the large structure):

Cozy Cocoon® (3 total) – Quiet/sensory retreat pods providing calming space and inclusive programming opportunities.

Double-Decker Cone Spinner – Standalone rotating spinner providing vestibular stimulation and dynamic movement play.

Chinning Bar – Overhead bar element supporting upper-body engagement (hanging/chinning exercise play).

Swing Sets (as labeled on plan):

5' Arch Swings – 4 Bays – (8) Belt Seats

5' Arch Swings – 3 Bays – (5) Belt Seats + (1) ADA Seat
